beamertheme-niederrhein

Documentation and examples

Version 1.5

Installation

Two ways to load the package:

- Installed via CTAN/TeX Live: `\usepackage{beamertheme-niederrhein}` is enough.
- Kept locally next to your own `.tex` file (no CTAN installation): `\usepackage{beamertheme-niederrhein}` still works as long as `beamertheme-niederrhein.sty` and `hsnr-logo.png` sit in the same directory.
- Compiled with LuaLaTeX, the logo is embedded automatically – no external `hsnr-logo.png` needed. With pdfLaTeX/XeLaTeX, `hsnr-logo.png` is expected in the project directory.

See README.md for the full installation path.

Basic Slide Types

Title Slide and Section Divider

Two commands structure a slide deck:

- `\titleslide{Title}{Subtitle}{Author}` – this slide was produced with it.
- `\sectionslide{Text}` – produces a full-page section heading like the previous slide.

beamertheme

Content Slide, Source Line, and Citations

Ordinary content slides are plain `frame` environments:

- Text is not bold by default.
- Citations with `\parencite{key}`, e.g. (Kuhn, 2018) or (Meier and Schmidt, 2021).
- For long content, use `[allowframebreaks]` and `\framebreak`.

Image Slides

Two images: \twoimages

`\twoimages{Title}{Image1}{Image2}{Caption}` – portrait and landscape images are both fitted automatically.

beamertheme

Three images: \threeimages

\threeimages{Title}{TopLeft}{TopRight}{Bottom}{Caption}

beamertheme

Four images: \fourimages

\fourimages{Title}{TopLeft}{TopRight}{BottomLeft}{BottomRight}{Caption}

beamertheme

Image Slides – Notes

All three image-slide commands share the same conventions:

- There is exactly **one** shared caption for the whole slide, never a caption per image.
- Each image keeps its aspect ratio via `keepaspectratio` and is constrained to the available space.

Further Notes

Three points that matter in practice:

- The title slide, section divider, and logo use a TikZ overlay – compile twice after any change, otherwise text is missing on these slides.
- Bibliography: `pdflatex`, `bibtex8`, `pdflatex`, `pdflatex` – in this order.
- Print the theme's version with `\version` resp. `\themeversion`: currently version 1.5.
